

Mohamed Sameer Work Samples

FinTech Leading App

The project was a bundle of digital banking applications that provides a range of financial services to its users, whether they were other Banks or financial service providers, Corporates, Suppliers, Merchants, or consumers.

The apps have been developed to make banking more accessible and convenient for customers, with features such as online banking, instant transfers, bill payments, mobile wallet issuance and management, credit accounts and loans management, and budgeting tools.

The Bank team was facing a challenge in developing new features for their new mobile application. They had ideas for random new features but lacked a structured approach to market analysis and also documenting the requirements and specifications. As a result, there was a lack of clarity and alignment among the stakeholders including multiple different teams on the features' scope, leading to confusion and delays in development.

I joined this project as a senior product manager and acted as a business analyst most of the time to help them document the requirements and specifications for new features. I worked closely with the CEO and the different teams across the bank and with the Product Owner and Development team to understand their ideas, analyze the requirements, and I developed the Business Requirements Document (BRD) for the new Apps.

I began by scheduling meetings with everyone including the product owner and the Development team to gather the initial requirements for each feature. During these meetings, the BA used techniques such as brainstorming, stakeholder analysis, and defining features list and use cases list to identify the scope of each feature and the expected outcomes, the detailed requirement, and user stories.

After gathering the initial requirements, I worked on developing the BRD for each App. The BRD included details such as the goals and purpose, business objectives, features list, use cases list with diagrams and written flow, functional requirements, non-functional requirements, user stories, and acceptance criteria.

To ensure that the BRD was complete and accurate, I reviewed and refined it several times with the stakeholders. I also used visual aids like flowcharts, and wireframes to help stakeholders visualize the feature and understand its requirements.

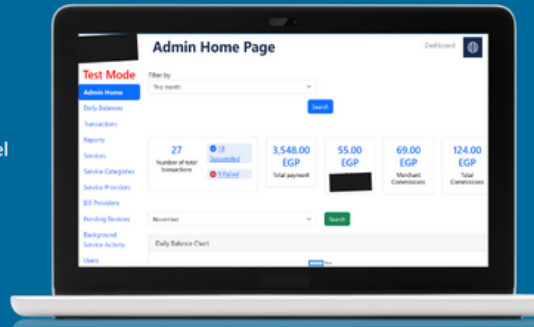

My work on the BRD and business analysis process helped the Leading Bank to achieve a structured approach to documenting requirements and specifications for their new mobile apps. As a result, there was a better understanding of the scope and expectations of each feature, and the development team could deliver the features on time and within budget.

UC-XXX Merchant request a credit account

Use Case Diagram

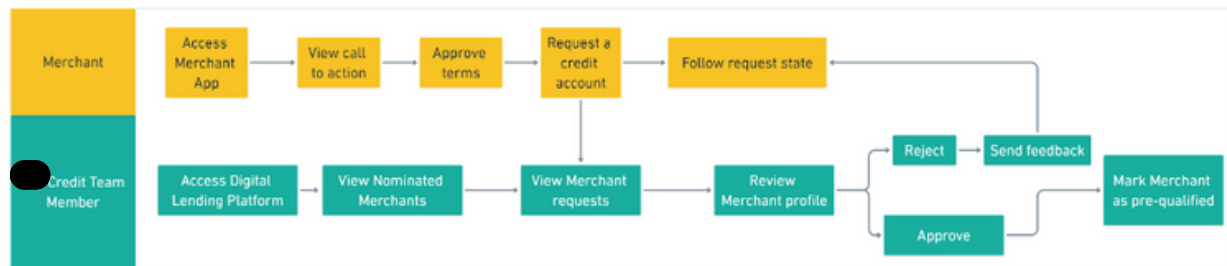

Figure ** Merchant credit account request process

Use Case Specifications

Short Description / Goal of the Use Case

This use case describes how a merchant requests a credit account, where the Merchant can request a credit account using the Merchant Mobile App and Credit Team can review these requests.

Goal: To allow a merchant to request a credit account via the Mobile App, and to enable the Credit Team to review and process the request.

Actor(s)

- Merchant
- Credit Team Member
- Sales Team Member (Merchant account manager)
- Core

Pre-conditions

The Merchant has a account and is logged in to the Mobile App.

The Credit Team has access to the platform and has the necessary permissions to review and process credit account requests.

The platform has been set up to support merchant credit accounts.

Basic flow

1. The Merchant opens the Mobile App, find and selects the "Request Credit Account" option.
2. The app prompts the Merchant to provide the following information:
 - a. Business name and legal entity type
 - b. Business registration number
 - c. Date of incorporation
 - d. Business address
 - e. Business phone number and email address
 - f. Tax number
 - g. Annual revenue
 - h. Bank account information
 - i. Amount of credit requested
3. The Merchant enters the required information and clicks "Submit".
4. The DLP receives the request and sends a notification to the Credit Team.
5. The Credit Team logs into the platform and views the request in the nominated merchants list.
6. The Credit Team reviews the information provided by the Merchant and may perform additional due diligence such as a credit check and/or review of the Merchant's financial history. Based on the review, the Credit Team may approve or reject the request.
7. If the request is approved, the Credit Team assigns a credit limit to the Merchant's account and notifies the Merchant via the Mobile App.
8. If the request is rejected, the Credit Team notifies the Merchant via the Mobile App and provides an explanation for the rejection.

Alternative flows 1 ... n

If the Merchant provides incomplete or inaccurate information, the Credit Team may request additional information or clarification before making a decision on the request.

If the Credit Team is unable to verify the Merchant's financial history or determine the creditworthiness of the Merchant, they may reject the request.

If there are technical issues with the platform or Mobile App that prevent the request from being processed, the Merchant may need to try again at a later time.

Integration Requirements

- 1.
- 2.

Post-conditions

- Success: If the credit account request is approved, the Merchant can view the credit limit assigned to their account via the Mobile App.
- Failure: If the credit account request is rejected, the Merchant can view the rejection notification via the Mobile App and may have the opportunity to submit another request after addressing any issues that led to the rejection.

Eligibility Diagram

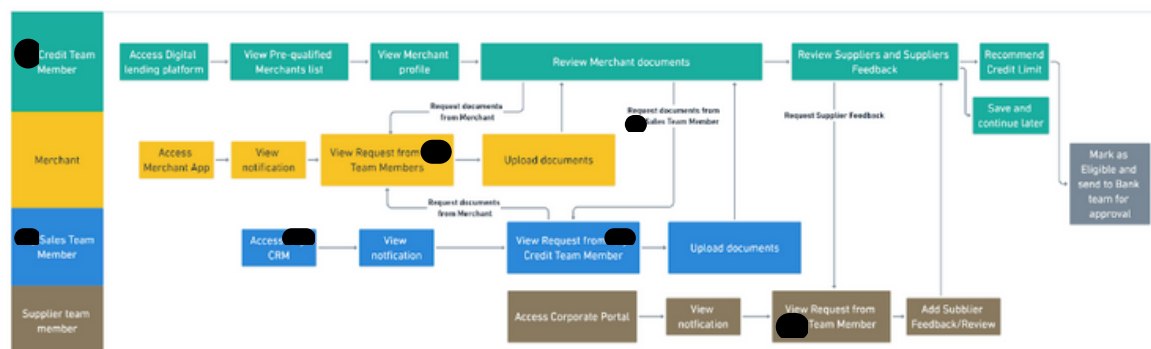

Figure 6 Credit Eligibility process

Use Case Specifications

Short Description / Goal of the Use Case

This use case describes the process of determining a merchant's credit eligibility, where a Credit Team member reviews the merchant's information, performance, documents, and supplier feedback, and recommends a credit limit before sending a profile to a bank for approval.

Actor(s)

- Credit Team Member: responsible for reviewing and assessing the merchant's eligibility.
- Merchant: the entity that is seeking credit from Taly.
- Sales Team Member: the merchant's account manager who may need to provide additional information or documents about the merchant to the Credit Team.
- Supplier Team Member: the contact person from the merchant's supplier who can provide feedback on the merchant's performance.

Pre-conditions

The Credit Team Member has access to the DLP. The merchant has provided the required information and documents to the Credit Team.

Basic flow

1. The Credit Team Member accesses the DLP.
2. The Credit Team Member views a list of pre-qualified or assigned merchants and selects one to review.
3. The Credit Team Member views the merchant profile and verifies the information provided by the merchant.
4. The Credit Team Member reviews the merchant's performance, such as history and payment behavior.
5. The Credit Team Member reviews the merchant's documents, and can request additional documents or upload documents from the merchant or its Sales account manager.
6. The Credit Team Member reviews the merchant's suppliers and their feedback on the merchant's performance, and can request supplier feedback from the suppliers if it is required or missing.
7. The Credit Team Member recommends the merchant's credit limit based on the review.
8. The Credit Team Member marks the merchant as eligible and sends the merchant profile to the bank (Approver) for final approval.

Alternative flows 1 ... n

1. If the Credit Team Member identifies any discrepancies or inconsistencies in the merchant's information or documents, the Credit Team Member can request clarifications or additional documents from the merchant or its Sales account manager.
2. If the Credit Team Member cannot find a supplier's feedback or is not satisfied with the feedback provided, the Credit Team Member can request additional feedback or information from the supplier or the merchant.

Integration Requirements

The DLP system should be integrated with the merchant database to access merchant information and profiles.

Post-conditions

- Success:
 1. The Credit Team Member recommends the merchant's credit limit and sends the report to the bank (Approver).
 2. The merchant's profile is sent to the bank for final approval.
- Failure:
 1. The Credit Team Member cannot determine the merchant's credit eligibility due to missing or insufficient information, unsatisfactory performance, or supplier feedback.
 2. The bank rejects the merchant's profile due to insufficient credit eligibility or other reasons.

Use Case-specific non-functional requirements

The DLP system should be secure and comply with data protection regulations.

The credit eligibility review process should be completed within a reasonable time frame.

The credit limit recommendation should be based on accurate and reliable information.

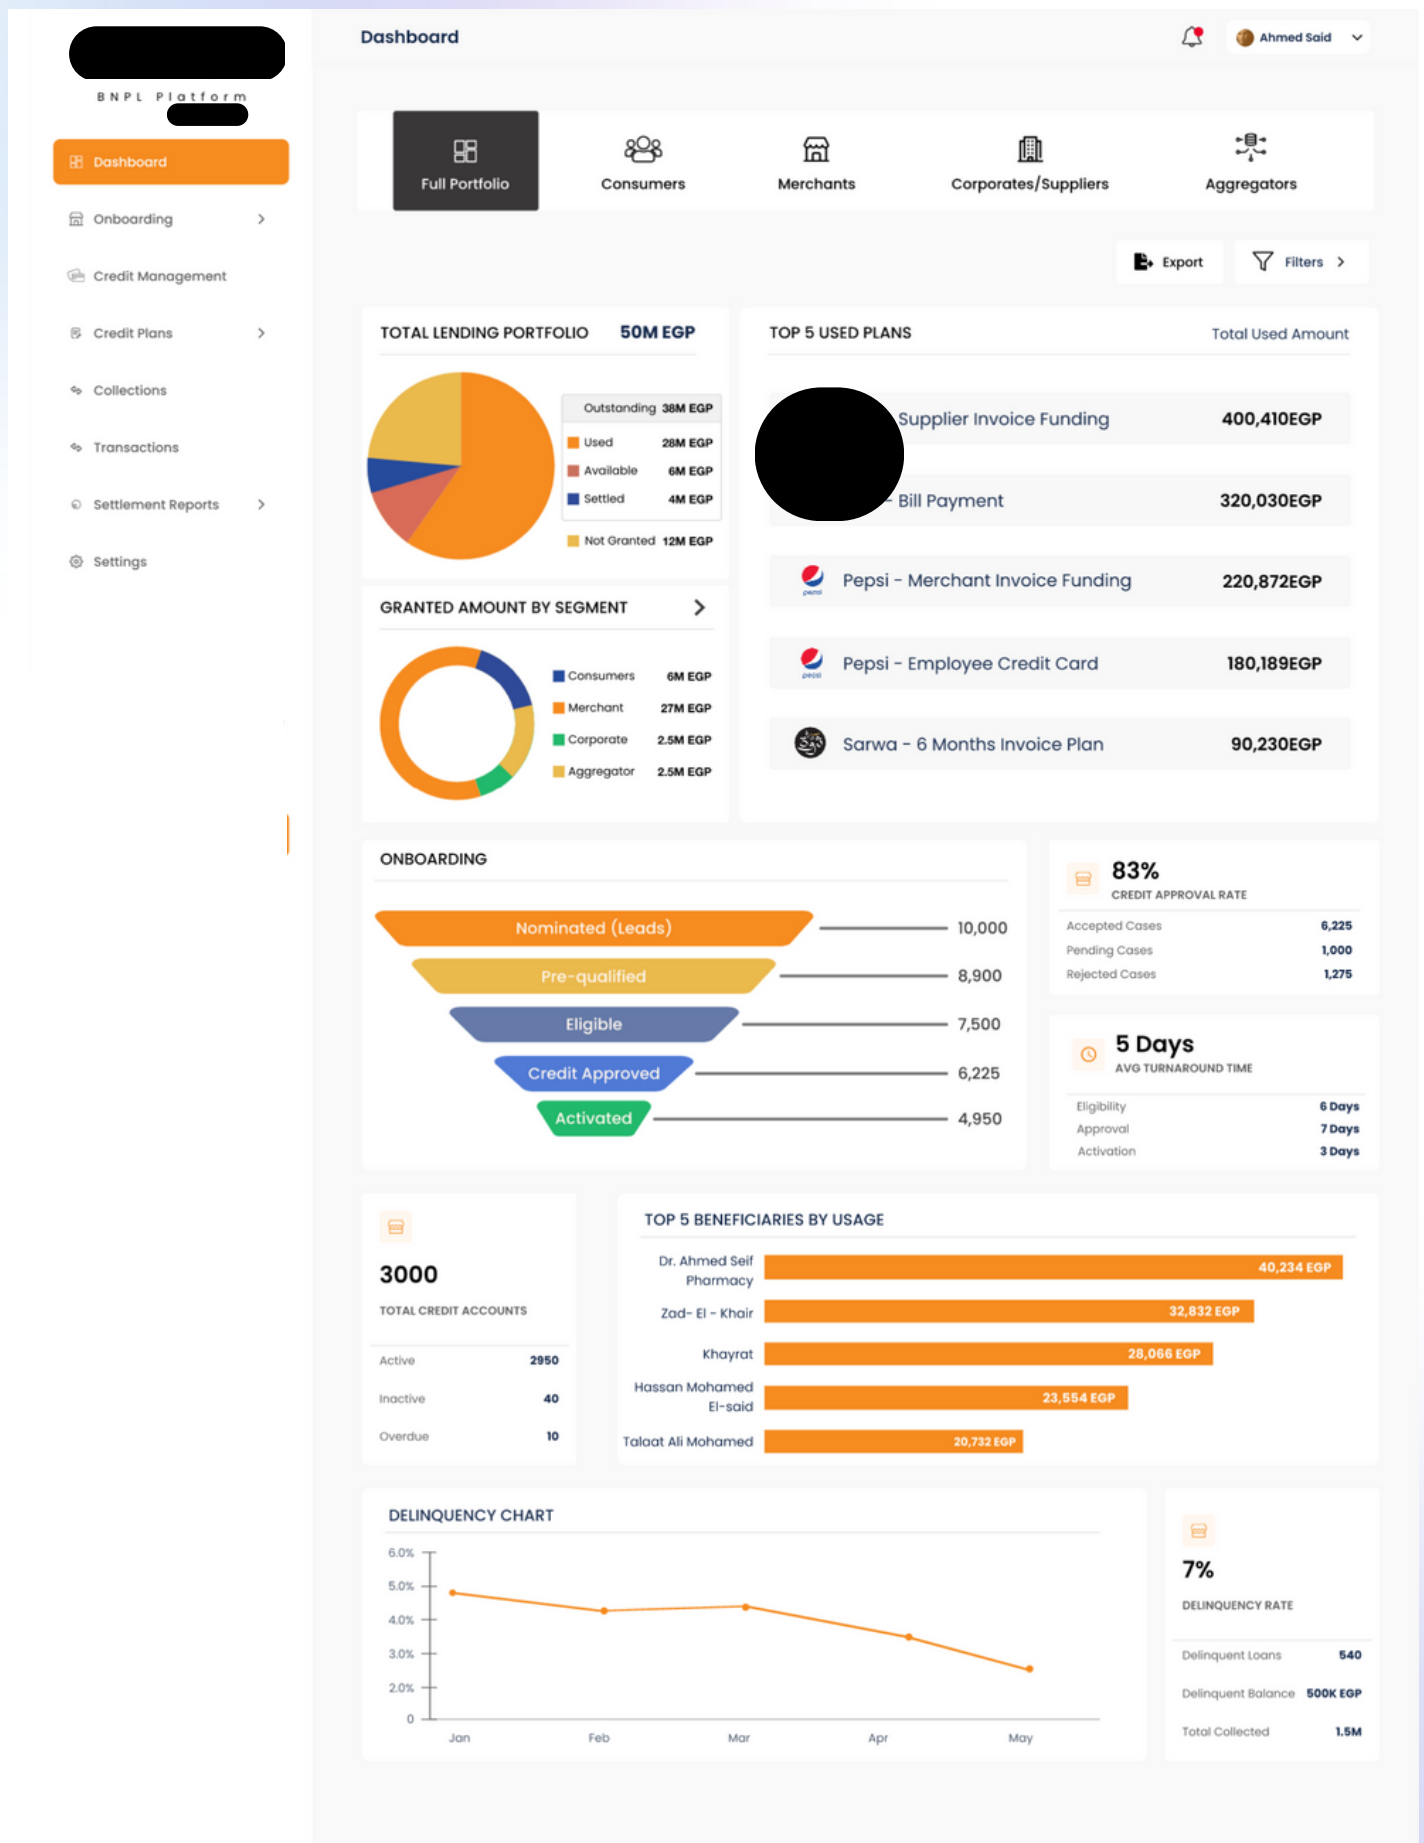

Special considerations

The credit eligibility criteria and credit limit recommendation may vary depending on the credit program or plan and its requirements.

User Stories

1. As a Credit Team member, I want to be able to view and access pre-qualified merchants so that I can quickly identify eligible candidates for credit.
2. As a Credit Team member, I want to be able to access a merchant's profile, performance, documents, and supplier feedback so that I can thoroughly review their credit eligibility.
3. As a Credit Team member, I want to be able to recommend a credit limit for the merchant so that the bank can make an informed decision.
4. As a Credit Team member, I want to be able to mark the merchant as eligible and send their profile to the bank so that they can receive credit if approved.

2 Authoring System Specification

This section describes the authoring application of the platform along with its modules and actors.

Following is a diagram of the Authoring Application showing all root modules, modules and actors of the system.

User Story	Description	Acceptance Criteria	Story Points	Status	Comments
6	Registration/Login Page	The user should be able to register himself in the system with all data required to operate on the system including the school, the level of education. The user should be able to login using social media platforms and recover his password when forgot.	100		User Friendly Registration Page -One Page registration with minimum number of fields. -Password recovery functionality. -Social sign in (using fb or twitter). -Field checks for format errors. -Secure login with strict procedure for failed attempts (e.g. captcha). Social Signin was existing before, we passed using it, and hide it from front-end. 20 The rest of requirements are done.
7	Re-development of the current system developed with all features currently implemented with a different technology	If it has been decided to re-code the whole system in Nodejs or (any other technology/language) than Python, the system should be replicated with all the currently implemented features, use case scenarios, validations, security procedures, infrastructural requirements according to the documentation available for the current system (roles, use cases, etc.) - Developed by Diaa	100		All Features in the current system implemented and tested using Unit test and Functional Acceptance Test. - All features in the system successfully tested using User test on all use case scenarios. -All required infrastructure, databases, data model are in place and documented.
8	Scalability of System Resources	The system should be able to scale in resources to meet up the load of users logging into the system. Also, the number of registered users or online users should not hinder the performance (or cessate) the service.	100		Successful stress test carried upon the system. -A massive amount of automatic agents running online at the same time doing registration, log in or taking an exam. Using docker for python app and nginx and the rest of services 20 and aws for the DB (as well as docker swarm machines) 40%
9	E-Payment Functionality	The user should be able to pay for the service (course, or bundle of courses) using the e-payment functionality. This services that should be implemented are: (-Credit Cards / pay pal =>) -Fawry -Scratch Cards	100		A live demonstration of successful e-payment for an agent using credit cards and fawry
10	Authentication change from session based to API key OO based in Python	as a pre-requisite for using Nodejs on the current implementation	100		We agreed on neglecting CreditCards for the time being and depend on coupon. Important for the mobile app, and microservices to communicate (authenticate and authorize) 100 with the core python app

BEFORE
